## TITLE OF THE INVENTION

### INTEGRIN ANTAGONISTS

#### FIELD OF THE INVENTION

5           The present invention is related to U.S. provisional applications Serial Nos. 60/047,177, filed May 20, 1997, 60/033,579, filed December 19, 1996, and 60/025,123, filed August 29, 1996, the contents of which are hereby incorporated by reference.

10           The present invention provides novel compounds and derivatives thereof, their synthesis, and their use as vitronectin receptor ligands. More particularly, the compounds of the present invention are  $\alpha v \beta 3$  antagonists,  $\alpha v \beta 5$  antagonists or dual  $\alpha v \beta 3 / \alpha v \beta 5$  antagonists useful for inhibiting bone resorption, treating and preventing osteoporosis, and inhibiting vascular restenosis, diabetic retinopathy, 15 macular degeneration, angiogenesis, atherosclerosis, inflammation and tumor growth.

#### BACKGROUND OF THE INVENTION

20           This invention relates to compounds for inhibiting bone resorption that is mediated by the action of a class of cells known as osteoclasts.

          Osteoclasts are multinucleated cells of up to 400  $\mu m$  in diameter that resorb mineralized tissue, chiefly calcium carbonate and calcium phosphate, in vertebrates. They are actively motile cells that 25 migrate along the surface of bone. They can bind to bone, secrete necessary acids and proteases and thereby cause the actual resorption of mineralized tissue from the bone.

          More specifically, osteoclasts are believed to exist in at least two physiological states. In the secretory state, osteoclasts are flat, 30 attach to the bone matrix via a tight attachment zone (sealing zone), become highly polarized, form a ruffled border, and secrete lysosomal enzymes and protons to resorb bone. The adhesion of osteoclasts to bone surfaces is an important initial step in bone resorption. In the

- 2 -

migratory or motile state, the osteoclasts migrate across bone matrix and do not take part in resorption until they attach again to bone.

Integrins are transmembrane, heterodimeric, glycoproteins which interact with extracellular matrix and are involved in osteoclast attachment, activation and migration. The most abundant integrin in osteoclasts (rat, chicken, mouse and human) is the vitronectin receptor, or  $\alpha v \beta 3$ , thought to interact in bone with matrix proteins that contain the RGD sequence. Antibodies to  $\alpha v \beta 3$  block bone resorption in vitro indicating that this integrin plays a key role in the resorptive process. There is increasing evidence to suggest that  $\alpha v \beta 3$  ligands can be used effectively to inhibit osteoclast mediated bone resorption in vivo in mammals.

The current major bone diseases of public concern are osteoporosis, hypercalcemia of malignancy, osteopenia due to bone metastases, periodontal disease, hyperparathyroidism, periarticular erosions in rheumatoid arthritis, Paget's disease, immobilization-induced osteopenia, and glucocorticoid treatment.

All these conditions are characterized by bone loss, resulting from an imbalance between bone resorption (breakdown) and bone formation, which continues throughout life at the rate of about 14% per year on the average. However, the rate of bone turnover differs from site to site, for example, it is higher in the trabecular bone of the vertebrae and the alveolar bone in the jaws than in the cortices of the long bones. The potential for bone loss is directly related to turnover and can amount to over 5% per year in vertebrae immediately following menopause, a condition which leads to increased fracture risk.

There are currently 20 million people with detectable fractures of the vertebrae due to osteoporosis in the United States. In addition, there are 250,000 hip fractures per year attributed to osteoporosis. This clinical situation is associated with a 12% mortality rate within the first two years, while 30% of the patients require nursing home care after the fracture.

Individuals suffering from all the conditions listed above would benefit from treatment with agents which inhibit bone resorption.

Additionally,  $\alpha v\beta 3$  ligands have been found to be useful in treating and/or inhibiting restenosis (recurrence of stenosis after corrective surgery on the heart valve), atherosclerosis, diabetic retinopathy, macular degeneration and angiogenesis (formation of new blood vessels). Moreover, it has been postulated that the growth of tumors depends on an adequate blood supply, which in turn is dependent on the growth of new vessels into the tumor; thus, inhibition of angiogenesis can cause tumor regression in animal models. (See, Harrison's Principles of Internal Medicine, 12th ed., 1991).  $\alpha v\beta 3$  antagonists, which inhibit angiogenesis, are therefore useful in the treatment of cancer for inhibiting tumor growth. (See e.g., Brooks et al., *Cell*, 79:1157-1164 (1994)).

Moreover, compounds of this invention can also inhibit neovascularization by acting as antagonists of the integrin receptor  $\alpha v\beta 5$ . A monoclonal antibody for  $\alpha v\beta 5$  has been shown to inhibit VEGF-induced angiogenesis in rabbit cornea and the chick chorioallantoic membrane model; M.C. Friedlander, et.al., *Science* 270, 1500-1502, 1995. Thus, compounds that antagonize  $\alpha v\beta 5$  are useful for treating and preventing macular degeneration, diabetic retinopathy, and tumor growth.

In addition, certain compounds of this invention antagonize both the  $\alpha v\beta 3$  and  $\alpha v\beta 5$  receptors. These compounds, referred to as "dual  $\alpha v\beta 3/\alpha v\beta 5$  antagonists," are useful for inhibiting bone resorption, treating and preventing osteoporosis, and inhibiting vascular restenosis, diabetic retinopathy, macular degeneration, angiogenesis, atherosclerosis, inflammation and tumor growth.

It is an object of the present invention to identify compounds which bind to the  $\alpha v\beta 3$  receptor,  $\alpha v\beta 5$  receptor or both the  $\alpha v\beta 3$  and  $\alpha v\beta 5$  receptors.

It is a further object of the invention to identify compounds which act as antagonists of the  $\alpha v\beta 3$  receptor. It is another object of the invention to identify  $\alpha v\beta 3$  antagonist compounds which are useful agents for inhibiting: bone resorption mediated by osteoclast cells, restenosis, atherosclerosis, inflammation, diabetic retinopathy, macular

- 4 -

degeneration and angiogenesis in animals, preferably mammals, especially humans. Still another object of the invention is to identify  $\alpha v \beta 3$  antagonists which cause tumor regression and/or inhibit tumor growth in animals.

5 A further object of the invention is to identify  $\alpha v \beta 3$  antagonists useful for preventing or treating osteoporosis. An additional object of the invention is to identify  $\alpha v \beta 3$  antagonists useful for treating cancer.

10 It has now been found that the compounds of the present invention,  $\alpha v \beta 3$  ligands, are useful for inhibiting bone resorption in mammals. Thus, the compounds of the present invention are useful for preventing or reducing the incidence of osteoporosis. Additionally, the  $\alpha v \beta 3$  ligands of the present invention are also useful for treating and/or inhibiting restenosis, diabetic retinopathy, macular degeneration, 15 atherosclerosis and/or angiogenesis in mammals.

## SUMMARY OF THE INVENTION

The present invention provides a method of eliciting a vitronectin receptor antagonizing effect in a mammal in need thereof, 20 comprising administering to the mammal a therapeutically effective amount of a compound of the formula

wherein X is selected from

25 a 5- or 6-membered monocyclic aromatic or nonaromatic ring system containing 0, 1, 2, 3 or 4 heteroatoms selected from N, O or S wherein the 5- or 6-membered ring system is either

Exemplifying the invention is the method wherein the  
vitronectin receptor antagonizing effect is an  $\alpha v \beta 3$  antagonizing effect.  
An illustration of the invention is the method wherein the  $\alpha v \beta 3$

- 23 -

antagonizing effect is selected from inhibition of: bone resorption, restenosis, angiogenesis, diabetic retinopathy, macular degeneration, inflammation or tumor growth. Preferably, the  $\alpha v \beta 3$  antagonizing effect is the inhibition of bone resorption.

5           An example of the invention is the method wherein the vitronectin receptor antagonizing effect is an  $\alpha v \beta 5$  antagonizing effect. More specifically, the  $\alpha v \beta 5$  antagonizing effect is selected from inhibition of: restenosis, angiogenesis, diabetic retinopathy, macular degeneration, inflammation or tumor growth.

10           Illustrating the invention is the method wherein the vitronectin receptor antagonizing effect is a dual  $\alpha v \beta 3 / \alpha v \beta 5$  antagonizing effect. More particularly, the dual  $\alpha v \beta 3 / \alpha v \beta 5$  antagonizing effect is selected from inhibition of: bone resorption, restenosis, angiogenesis, diabetic retinopathy, macular degeneration,  
15 inflammation or tumor growth.

In a second embodiment of the present invention is a method of eliciting an  $\alpha v \beta 3$  antagonizing effect in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of a compound of the formula

and the pharmaceutically acceptable salts thereof.

More particularly illustrating the invention is a  
30 pharmaceutical composition comprising any of the compounds described  
above and a pharmaceutically acceptable carrier. Another example of  
the invention is a pharmaceutical composition made by combining any  
of the compounds described above and a pharmaceutically acceptable  
carrier. Another illustration of the invention is a process for making a

- 70 -

pharmaceutical composition comprising combining any of the compounds described above and a pharmaceutically acceptable carrier.

Further illustrating the invention is a method of treating and/or preventing a condition mediated by antagonism of a vitronectin receptor in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of any of the compounds described above. Preferably, the condition is selected from bone resorption, osteoporosis, restenosis, diabetic retinopathy, macular degeneration, angiogenesis, atherosclerosis, inflammation, cancer and tumor growth. More preferably, the condition is selected from osteoporosis and cancer. Most preferably, the condition is osteoporosis.

More specifically exemplifying the invention is a method of eliciting a vitronectin antagonizing effect in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of any of the compounds or any of the pharmaceutical compositions described above. Preferably, the vitronectin antagonizing effect is an  $\alpha v\beta 3$  antagonizing effect; more specifically the  $\alpha v\beta 3$  antagonizing effect is selected from inhibition of bone resorption, inhibition of restenosis, inhibition of atherosclerosis, inhibition of angiogenesis, inhibition of diabetic retinopathy, inhibition of macular degeneration, inhibition of inflammation or inhibition of tumor growth. Most preferably, the  $\alpha v\beta 3$  antagonizing effect is inhibition of bone resorption. Alternatively, the vitronectin antagonizing effect is an  $\alpha v\beta 5$  antagonizing effect or a dual  $\alpha v\beta 3/\alpha v\beta 5$  antagonizing effect. Examples of  $\alpha v\beta 5$  antagonizing effects are inhibition of: restenosis, atherosclerosis, angiogenesis, diabetic retinopathy, macular degeneration, inflammation or tumor growth. Examples of dual  $\alpha v\beta 3/\alpha v\beta 5$  antagonizing effects are inhibition of: bone resorption, restenosis, atherosclerosis, angiogenesis, diabetic retinopathy, macular degeneration, inflammation or tumor growth.

Additional examples of the invention are methods of inhibiting bone resorption and of treating and/or preventing osteoporosis in a mammal in need thereof, comprising administering to

- 71 -

the mammal a therapeutically effective amount of any of the compounds or any of the pharmaceutical compositions described above.

Further exemplifying the invention is any of the compositions described above, further comprising a therapeutically effective amount of a second bone resorption inhibitor; preferably, the  
5 second bone resorption inhibitor is alendronate.

More particularly illustrating the invention is any of the methods of treating and/or preventing osteoporosis and/or of inhibiting bone resorption described above, wherein the compound is administered  
10 in combination with a second bone resorption inhibitor; preferably, the second bone resorption inhibitor is alendronate.

Additional illustrations of the invention are methods of treating hypercalcemia of malignancy, osteopenia due to bone metastases, periodontal disease, hyperparathyroidism, periarticular  
15 erosions in rheumatoid arthritis, Paget's disease, immobilization-induced osteopenia, and glucocorticoid treatment in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of any of the compounds or any of the pharmaceutical compositions described above.

20 More particularly exemplifying the invention is the use of any of the compounds described above in the preparation of a medicament for the treatment and/or prevention of osteoporosis in a mammal in need thereof. Still further exemplifying the invention is the use of any of the compounds described above in the preparation of a  
25 medicament for the treatment and/or prevention of: bone resorption, tumor growth, cancer, restenosis, atherosclerosis, diabetic retinopathy, macular degeneration, inflammation and/or angiogenesis.

Additional illustrations of the invention are methods of treating tumor growth in a mammal in need thereof, comprising  
30 administering to the mammal a therapeutically effective amount of a compound described above and one or more agents known to be cytotoxic or antiproliferative, e.g., taxol and doxorubicin.

## DETAILED DESCRIPTION OF THE INVENTION

Representative compounds of the present invention are integrin antagonists which display submicromolar affinity for the human  $\alpha v \beta 3$  receptor. Compounds of this invention are therefore useful for  
5 treating mammals suffering from a bone condition caused or mediated by increased bone resorption, who are in need of such therapy. Pharmacologically effective amounts of the compounds, including pharmaceutically acceptable salts thereof, are administered to the mammal, to inhibit the activity of mammalian osteoclasts.

10 The compounds of the present invention are administered in dosages effective to antagonize the  $\alpha v \beta 3$  receptor where such treatment is needed, as, for example, in the prevention or treatment of osteoporosis. For use in medicine, the salts of the compounds of this invention refer to non-toxic "pharmaceutically acceptable salts." Other  
15 salts may, however, be useful in the preparation of the compounds according to the invention or of their pharmaceutically acceptable salts. Salts encompassed within the term "pharmaceutically acceptable salts" refer to non-toxic salts of the compounds of this invention which are generally prepared by reacting the free base with a suitable organic or  
20 inorganic acid. Representative salts include the following:

Acetate, Benzenesulfonate, Benzoate, Bicarbonate, Bisulfate, Bitartrate, Borate, Bromide, Calcium, Camsylate, Carbonate, Chloride, Clavulanate, Citrate, Dihydrochloride, Edetate, Edisylate, Estolate, Esylate, Fumarate, Gluceptate, Gluconate, Glutamate,  
25 Glycollylarsanilate, Hexylresorcinate, Hydrabamine, Hydrobromide, Hydrochloride, Hydroxynaphthoate, Iodide, Isothionate, Lactate, Lactobionate, Laurate, Malate, Maleate, Mandelate, Mesylate, Methylbromide, Methylnitrate, Methylsulfate, Mucate, Napsylate, Nitrate, N-methylglucamine ammonium salt, Oleate, Oxalate, Pamoate  
30 (Embonate), Palmitate, Pantothenate, Phosphate/diphosphate, Polygalacturonate, Salicylate, Stearate, Sulfate, Subacetate, Succinate, Tannate, Tartrate, Teoclate, Tosylate, Triethiodide and Valerate. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may include

- 73 -

alkali metal salts, e.g., sodium or potassium salts; alkaline earth metal salts, e.g., calcium or magnesium salts; and salts formed with suitable organic ligands, e.g., quaternary ammonium salts.

The compounds of the present invention, may have chiral  
5 centers and occur as racemates, racemic mixtures, diastereomeric mixtures, and as individual diastereomers, or enantiomers with all isomeric forms being included in the present invention. Therefore, where a compound is chiral, the separate enantiomers, substantially free of the other, are included within the scope of the invention; further  
10 included are all mixtures of the two enantiomers. Also included within the scope of the invention are polymorphs and hydrates of the compounds of the instant invention.

The present invention includes within its scope prodrugs of the compounds of this invention. In general, such prodrugs will be  
15 functional derivatives of the compounds of this invention which are readily convertible in vivo into the required compound. Thus, in the methods of treatment of the present invention, the term "administering" shall encompass the treatment of the various conditions described with the compound specifically disclosed or with a compound which may not  
20 be specifically disclosed, but which converts to the specified compound in vivo after administration to the patient. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "Design of Prodrugs," ed. H. Bundgaard, Elsevier, 1985. Metabolites of these compounds include active species  
25 produced upon introduction of compounds of this invention into the biological milieu.

The term "therapeutically effective amount" shall mean that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human that is being  
30 sought by a researcher or clinician.

The term "vitronectin receptor antagonist," as used herein, refers to a compound which binds to and antagonizes either the  $\alpha v \beta 3$  receptor or the  $\alpha v \beta 5$  receptor, or a compound which binds to and

- 74 -

antagonizes both the  $\alpha v\beta 3$  and  $\alpha v\beta 5$  receptors (i.e., a dual  $\alpha v\beta 3/\alpha v\beta 5$  receptor antagonist).

The term "bone resorption," as used herein, refers to the process by which osteoclasts degrade bone.

5       The term "alkyl" shall mean straight or branched chain alkanes of one to ten total carbon atoms, or any number within this range (i.e., methyl, ethyl, 1-propyl, 2-propyl, n-butyl, s-butyl, t-butyl, etc.).

10       The term "alkenyl" shall mean straight or branched chain alkenes of two to ten total carbon atoms, or any number within this range.

The term "alkynyl" shall mean straight or branched chain alkynes of two to ten total carbon atoms, or any number within this range.

15       The term "cycloalkyl" shall mean cyclic rings of alkanes of three to eight total carbon atoms, or any number within this range (i.e., cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or cyclooctyl).

20       The term "cycloheteroalkyl," as used herein, shall mean a 3- to 8-membered fully saturated heterocyclic ring containing one or two heteroatoms chosen from N, O or S. Examples of cycloheteroalkyl groups include, but are not limited to piperidinyl, pyrrolidinyl, azetidinyl, morpholinyl, piperazinyl.

25       The term "alkoxy," as used herein, refers to straight or branched chain alkoxides of the number of carbon atoms specified (e.g., C1-5 alkoxy), or any number within this range (i.e., methoxy, ethoxy, etc.).

30       The term "aryl," as used herein, refers to a monocyclic or polycyclic system composed of 5- and 6-membered fully unsaturated or partially unsaturated rings, such that the system comprises at least one fully unsaturated ring, wherein the rings contain 0, 1, 2, 3 or 4 heteroatoms chosen from N, O or S, and either unsubstituted or substituted with one or more groups independently selected from hydrogen, halogen, C1-10 alkyl, C3-8 cycloalkyl, aryl, aryl C1-8 alkyl,

- 75 -

amino, amino C<sub>1-8</sub> alkyl, C<sub>1-3</sub> acylamino, C<sub>1-3</sub> acylamino C<sub>1-8</sub> alkyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkylamino C<sub>1-8</sub> alkyl, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> dialkylamino-C<sub>1-8</sub> alkyl, C<sub>1-4</sub> alkoxy, C<sub>1-4</sub> alkoxy C<sub>1-6</sub> alkyl, hydroxycarbonyl, hydroxycarbonyl C<sub>1-6</sub> alkyl, C<sub>1-5</sub> alkoxycarbonyl, C<sub>1-3</sub> alkoxycarbonyl C<sub>1-6</sub> alkyl, hydroxycarbonyl C<sub>1-6</sub> alkyloxy, hydroxy, hydroxy C<sub>1-6</sub> alkyl, cyano, trifluoromethyl, oxo or C<sub>1-5</sub> alkylcarbonyloxy. Examples of aryl include, but are not limited to, phenyl, naphthyl, pyridyl, pyrazinyl, pyrimidinyl, imidazolyl, benzimidazolyl, indolyl, thienyl, furyl, dihydrobenzofuryl, benzo(1,3) dioxolane, oxazolyl, isoxazolyl and thiazolyl, which are either unsubstituted or substituted with one or more groups independently selected from hydrogen, halogen, C<sub>1-10</sub> alkyl, C<sub>3-8</sub> cycloalkyl, aryl, aryl C<sub>1-8</sub> alkyl, amino, amino C<sub>1-8</sub> alkyl, C<sub>1-3</sub> acylamino, C<sub>1-3</sub> acylamino C<sub>1-8</sub> alkyl, C<sub>1-6</sub> alkylamino, C<sub>1-6</sub> alkylamino-C<sub>1-8</sub> alkyl, C<sub>1-6</sub> dialkylamino, C<sub>1-6</sub> dialkylamino C<sub>1-8</sub> alkyl, C<sub>1-4</sub> alkoxy, C<sub>1-4</sub> alkoxy C<sub>1-6</sub> alkyl, hydroxycarbonyl, hydroxycarbonyl C<sub>1-6</sub> alkyl, C<sub>1-5</sub> alkoxycarbonyl, C<sub>1-3</sub> alkoxycarbonyl C<sub>1-6</sub> alkyl, hydroxycarbonyl C<sub>1-6</sub> alkyloxy, hydroxy, hydroxy C<sub>1-6</sub> alkyl, cyano, trifluoromethyl, oxo or C<sub>1-5</sub> alkylcarbonyloxy. Preferably, the aryl group is unsubstituted, mono-, di-, tri- or tetra-substituted with one to four of the above-named substituents; more preferably, the aryl group is unsubstituted, mono-, di- or tri-substituted with one to three of the above-named substituents; most preferably, the aryl group is unsubstituted, mono- or di-substituted with one to two of the above-named substituents.

Whenever the term "alkyl" or "aryl" or either of their prefix roots appear in a name of a substituent (e.g., aryl C<sub>0-8</sub> alkyl) it shall be interpreted as including those limitations given above for "alkyl" and "aryl." Designated numbers of carbon atoms (e.g., C<sub>1-10</sub>) shall refer independently to the number of carbon atoms in an alkyl or cyclic alkyl moiety or to the alkyl portion of a larger substituent in which alkyl appears as its prefix root.

The terms "arylalkyl" and "alkylaryl" include an alkyl portion where alkyl is as defined above and to include an aryl portion where aryl is as defined above. The C<sub>0-m</sub> or C<sub>1-m</sub> designation where

- 76 -

m may be an integer from 1-10 or 2-10 respectively refers to the alkyl component of the arylalkyl or alkylaryl unit. Examples of arylalkyl include, but are not limited to, benzyl, fluorobenzyl, chlorobenzyl, phenylethyl, phenylpropyl, fluorophenylethyl, chlorophenylethyl, thienylmethyl, thienylethyl, and thienylpropyl. Examples of alkylaryl include, but are not limited to, toluene, ethylbenzene, propylbenzene, methylpyridine, ethylpyridine, propylpyridine and butylpyridine.

When substituent R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup>, R<sup>10</sup>, R<sup>11</sup>, R<sup>12</sup>, R<sup>13</sup> or R<sup>14</sup> includes the definition C<sub>0</sub> (e.g., aryl C<sub>0</sub>-8 alkyl), the group modified by C<sub>0</sub> is not present in the substituent. Similarly, when any of the variables m, q, r or s is zero, then the group modified by the variable is not present; for example, when s is zero, the group  $-(CH_2)_s C \equiv CH$  is  $-C \equiv CH$ . In addition, the substituent "(C<sub>1</sub>-6 alkyl)<sub>q</sub>amino" where q is zero; one or two, refers to an amino, C<sub>1</sub>-6 alkylamino and C<sub>1</sub>-6 dialkylamino group, respectively. When a C<sub>1</sub>-6 dialkylamino substituent is intended, the C<sub>1</sub>-6 alkyl groups can be the same (e.g., dimethylamino) or different (e.g., N(CH<sub>3</sub>)(CH<sub>2</sub>CH<sub>3</sub>)). Similarly, the substituent "(aryl)<sub>q</sub>amino" or ["(aryl C<sub>1</sub>-6 alkyl)<sub>q</sub>amino"], where q is zero, one or two, refers to an amino, arylamino and diarylamino group, [or an amino, aryl C<sub>1</sub>-6 alkylamino or di-(aryl C<sub>1</sub>-6 alkyl)amino] respectively, where the aryl [or aryl C<sub>1</sub>-6 alkyl] groups in a diarylamino [or di-(aryl C<sub>1</sub>-6 alkyl)amino] substituent can be the same or different.

The term "halogen" shall include iodine, bromine, chlorine and fluorine.

The term "oxy" means an oxygen (O) atom. The term "thio" means a sulfur (S) atom. The term "oxo" shall mean =O.

The term "substituted" shall be deemed to include multiple degrees of substitution by a named substituent. Where multiple substituent moieties are disclosed or claimed, the substituted compound can be independently substituted by one or more of the disclosed or claimed substituent moieties, singly or plurally. By independently substituted, it is meant that the (two or more) substituents can be the same or different.

- 77 -

Under standard nomenclature used throughout this disclosure, the terminal portion of the designated side chain is described first, followed by the adjacent functionality toward the point of attachment. For example, a C<sub>1-5</sub> alkylcarbonylamino C<sub>1-6</sub> alkyl substituent is equivalent to

The present invention is also directed to combinations of the compounds of the present invention with one or more agents useful in the prevention or treatment of osteoporosis. For example, the compounds of the instant invention may be effectively administered in combination with effective amounts of other agents used in the treatment of osteoporosis such as bisphosphonate bone resorption inhibitors; preferably, the bone resorption inhibitor is the bisphosphonate alendronate, now sold as FOSAMAX<sup>®</sup>. Preferred combinations are simultaneous or alternating treatments of an  $\alpha_v\beta_3$  receptor antagonist of the present invention and FOSAMAX<sup>®</sup>.

In addition, the integrin ( $\alpha_v\beta_3$ ) antagonist compounds of the present invention may be effectively administered in combination with a growth hormone secretagogue in the therapeutic or prophylactic treatment of disorders in calcium or phosphate metabolism and associated diseases. These diseases include conditions which can benefit from a reduction in bone resorption. A reduction in bone resorption should improve the balance between resorption and formation, reduce bone loss or result in bone augmentation. A reduction in bone resorption can alleviate the pain associated with osteolytic lesions and reduce the incidence and/or growth of those lesions. These diseases include: osteoporosis (including estrogen deficiency, immobilization, glucocorticoid induced and senile), osteodystrophy, Paget's disease, myositis ossificans, Bechterew's disease, malignant hypercalcemia, metastatic bone disease, periodontal disease, cholelithiasis, nephrolithiasis, urolithiasis, urinary calculus, hardening of the arteries (sclerosis), arthritis, bursitis, neuritis and tetany. Increased bone

- 78 -

resorption can be accompanied by pathologically high calcium and phosphate concentrations in the plasma, which would be alleviated by this treatment. Similarly, the present invention would be useful in increasing bone mass in patients with growth hormone deficiency.

- 5 Thus, preferred combinations are simultaneous or alternating treatments of an  $\alpha v \beta 3$  receptor antagonist of the present invention and a growth hormone secretagogue, optionally including a third component comprising FOSAMAX®.

- 10 In addition, the vitronectin receptor antagonist compounds of the present invention may be effectively administered in combination with one or more agents known to be cytotoxic or antiproliferative, e.g., taxol and doxorubicin.

- 15 In accordance with the method of the present invention, the individual components of the combination can be administered separately at different times during the course of therapy or concurrently in divided or single combination forms. The instant invention is therefore to be understood as embracing all such regimes of simultaneous or alternating treatment and the term "administering" is to be interpreted accordingly. It will be understood that the scope of combinations of the compounds of this invention with other agents useful for treating  $\alpha v \beta 3$  related conditions includes in principle any combination with any pharmaceutical composition useful for treating osteoporosis.

- 20 As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

- 25 The compounds of the present invention can be administered in such oral dosage forms as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixers, tinctures, suspensions, syrups and emulsions. Likewise, they may also be administered in intravenous (bolus or infusion), intraperitoneal, topical (e.g., ocular eyedrop), subcutaneous,
- 30

- 79 -

intramuscular or transdermal (e.g., patch) form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound desired can be employed as an  $\alpha v\beta 3$  inhibitor.

5           The dosage regimen utilizing the compounds of the present invention is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound  
10       or salt thereof employed. An ordinarily skilled physician, veterinarian or clinician can readily determine and prescribe the effective amount of the drug required to prevent, counter or arrest the progress of the condition.

          Oral dosages of the present invention, when used for the  
15       indicated effects, will range between about 0.01 mg per kg of body weight per day (mg/kg/day) to about 100 mg/kg/day, preferably 0.01 to 10 mg/kg/day, and most preferably 0.1 to 5.0 mg/kg/day. For oral administration, the compositions are preferably provided in the form of tablets containing 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0,  
20       50.0, 100 and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. A medicament typically contains from about 0.01 mg to about 500 mg of the active ingredient, preferably, from about 1 mg to about 100 mg of active ingredient. Intravenously, the most preferred doses will range  
25       from about 0.1 to about 10 mg/kg/minute during a constant rate infusion. Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, preferred compounds for the present invention can be  
30       administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in the art. To be administered in the form of a transdermal delivery system, the dosage

- 80 -

administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

In the methods of the present invention, the compounds herein described in detail can form the active ingredient, and are typically administered in admixture with suitable pharmaceutical diluents, excipients or carriers (collectively referred to herein as 'carrier' materials) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum and the like.

The compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

Compounds of the present invention may also be delivered by the use of monoclonal antibodies as individual carriers to which the

- 81 -

compound molecules are coupled. The compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol, polyhydroxy-ethylaspartamide-phenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyglycolic acid, copolymers of polyactic and polyglycolic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and crosslinked or amphipathic block copolymers of hydrogels.

The novel compounds of the present invention were prepared according to the procedure of the following schemes and examples, using appropriate materials and are further exemplified by the following specific examples. The most preferred compounds of the invention are any or all of those specifically set forth in these examples. These compounds are not, however, to be construed as forming the only genus that is considered as the invention, and any combination of the compounds or their moieties may itself form a genus. The following examples further illustrate details for the preparation of the compounds of the present invention. Those skilled in the art will readily understand that known variations of the conditions and processes of the following preparative procedures can be used to prepare these compounds. All temperatures are degrees Celsius unless otherwise noted.

- 83 -

The following Schemes and Examples describe procedures for making representative compounds of the present invention.

Moreover, by utilizing the procedures described in detail in PCT International Application Publication Nos. WO95/32710, published 7

- 5 December 1995, and WO95/17397, published 29 June 1995, in conjunction with the disclosure contained herein, one of ordinary skill in the art can readily prepare additional compounds of the present invention claimed herein.

- More specifically, procedures for preparing the N-terminus  
10 of the compounds of the present invention are described in WO 95/32710. Additionally, for a general review describing the synthesis of  $\beta$ -alanines which can be utilized as the C-terminus of the compounds of the present invention, see Cole, D.C., *Recent Stereoselective Synthetic Approaches to  $\beta$ -Amino Acids*, *Tetrahedron*, 1994, 50, 9517-9582;

2-Oxo-3-(3-oxobutyl)piperidine (1-3)

A stirred solution of TMEDA (3.0 g, 20 mmol), 0.5 M LDA (6 mL, in THF), and THF (10 mL) at -78°C was treated with 1-1 (1.7 g, 10 mmol) (for preparation, see: JOC, 1990, 55, 3682) to effect  
5 an orange solution.

After 1 h, the iodide 1-2 (2.4 g, 10 mmol) (*J. Org. Chem.*, 1983, 48, 5381) was added to the orange solution and the resulting solution stirred for 2 h at -78°C, 3 h at -15°C and then 16 h at ambient temperature. The reaction mixture was concentrated and then treated  
10 with 1N HCl (30 mL). The mixture was then basified with 1N NaOH/brine followed by extraction with EtOAc (3x). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated to give a yellow oil. Flash chromatography (silica, EtOAc → 10% CH<sub>3</sub>OH/EtOAc) gave 1-3 as a colorless solid.

2-Oxo-3-[2-([1,8]-naphthyridin-2-yl)ethyl]piperidine (1-5)

20 A solution of 1-3 (0.25 g, 1.5 mmol), L-proline (85 mg, 0.75 mmol), 1-4 (0.18 g, 1.5 mmol) (for preparation see: *Synth. Commun.* 1987, 17, 1695), and ethanol (10 mL) was refluxed for 24 hr. The cooled solution was concentrated and the residue purified by flash chromatography (silica, EtOAc → 20% CH<sub>3</sub>OH/EtOAc) to give 1-5 as a  
25 solid.

SCHEME 3 (cont'd)4-(Propyl-2-ene)butyric acid (3-2)

To a stirred suspension of methyltriphenylphosphonium bromide (67.7 g, 190 mmol) in 1 L THF at 0° C was added a solution of sodium bis(trimethylsilyl)amide (190 mL, 190 mmol, 1M THF) . After an additional 30 minutes, 3-1 ethyl 4-acetylbutyrate (Aldrich Chemical Co.)(25.0 g, 158 mmol) was added, and the mixture stirred for 18 h. The mixture was filtered, and the filtrate concentrated. The residue was triturated with hexanes, and then filtered. Following evaporative

A solution of the above olefin (15.4 g, 98.6 mmol), 1 N NaOH (150 mL), and EtOH (300 mL) was stirred at ambient temperature for 2 h. Following acidification with 1 N HCl, the mixture was extracted with ether. The ether layer was washed with brine, dried over magnesium sulfate, and concentrated to give 3-2 as a colorless oil. <sup>1</sup>H NMR (300 MHz, CHCl<sub>3</sub>) δ 4.70 (d, 2H, J=13 Hz), 2.27 (t, 2H, J=7 Hz), 2.06 (t, 2H, J= 7 Hz), 1.72 (m, 5H).

15 (4-(Propyl-2-ene)butanoyl)-4(R)-benzyl-2-oxazolidinone (3-3)

To a solution of 3-2 (6.0 g , 46.8 mmol) in THF (200 ml) at -78° C was added triethylamine (7.19 mL , 51.5 mmol) followed by pivaloyl chloride (6.35 mL , 51.5 mmol). The mixture was warmed to 0°C for 1 h, then recooled to -78° C. In a separate flask, of (R)-(+)-4-benzyl-2-oxazolidinone (9.15 g, 51.5 mmol) was dissolved in THF (100 mL), cooled to -78° C, and n-BuLi (32.3 mL, 51.5 mmol; 1.6 M hexanes) was added dropwise. After 10 minutes, the lithium oxazolidinone was added to the pivalic anhydride. After 10 minutes, the mixture was warmed to 0° C for 1.5 h. The mixture was then poured into ethyl acetate, washed with aqueous sodium bicarbonate, and dried over magnesium sulfate. Following evaporative removal of the solvent, the residue was chromatographed (silica gel, dichloromethane) to give 3-3 as a slightly yellow oil.

To a solution of 3-3 (11.0 g, 38.3 mmol) in THF (60 mL) at -78° C was added a solution of sodium bis(trimethylsilyl)amide (42.1 mL, 42.1 mmol; 1M/THF). After 20 min, 3-4 (16.2 ml, 115 mmol) was added over 5 min, and the resulting mixture stirred for 1.5 h at -78° C, then 2 h at -15° C. The mixture was diluted with hexanes, washed with sat. ammonium chloride, and dried over sodium sulfate. Following evaporative removal of the solvent, the residue was chromatographed (silica gel, 14% ethyl acetate/hexanes) to give 3-5 as a colorless oil. N-(4-Iodo-phenylsulfonylamino)-L-asparagine (8-2)

To a stirred solution of acid 8-1 (4.39 g, 33.2 mmol), NaOH (1.49 g, 37.2 mmol), dioxane (30 ml) and H<sub>2</sub>O (30 ml) at 0°C was added pipsyl chloride (10.34 g, 34.2 mmol). After ~5 minutes, NaOH (1.49, 37.2 mmol) dissolved in 15 ml H<sub>2</sub>O, was added followed by the removal of the cooling bath. After 2.0 h, the reaction mixture was concentrated. The residue was dissolved in H<sub>2</sub>O (300 ml) and then washed with EtOAc. The aqueous portion was cooled to 0°C and then acidified with concentrated HCl. The solid was collected and then washed with Et<sub>2</sub>O to provide acid 8-2 as a white solid. <sup>1</sup>H NMR (300 MHz, D<sub>2</sub>O) δ 7.86 (d, 2H, J=8Hz), 7.48 (d, 2H, J=8Hz) 3.70 (m, 1H), 2.39 (m, 2H).

2(S)-(4-Iodo-phenylsulfonylamino)-β-alanine (8-3)

To a stirred solution of NaOH (7.14 g, 181.8 mmol) and H<sub>2</sub>O (40 ml) at 0°C was added Br<sub>2</sub> (1.30 ml, 24.9 mmol) dropwise over a ten minute period. After ~5 minutes, acid 8-2 (9.9 g, 24.9 mmol), NaOH (2.00 g, 49.8 mmol) and H<sub>2</sub>O (35 ml) were combined, cooled to 0°C and then added in a single portion to the reaction. After stirring for 20 minutes at 0°C, the reaction was heated to 90°C for 30 minutes and then recooled to 0°C. The pH was adjusted to ~7 by dropwise addition of concentrated HCl. The solid was collected, washed with EtOAc, and then dried *in vacuo* to provide acid 8-3 as a white solid. <sup>1</sup>H NMR (300 MHz, D<sub>2</sub>O) δ 8.02 (d, 2H, J=8Hz), 7.63 (d, 2H, J=8Hz), 4.36 (m, 1H), 3.51 (dd, 1H, J=5Hz, 13Hz) 3.21 (m, 1H).

Ethyl 2(S)-(4-iodo-phenylsulfonylamino)-β-alanine-hydrochloride (8-4)

HCl gas was rapidly bubbled through a suspension of acid 8-3 (4.0 g, 10.81 mmol) in EtOH (50 ml) at 0°C for 10 minutes. The cooling bath was removed and the reaction was heated to 60°C. After 18 h, the reaction was concentrated to provide ester 8-4 as a white solid. <sup>1</sup>H NMR (300 MHz, CD<sub>3</sub>OD) δ 7.98 (d, 2H, J=8Hz), 7.63 (d, 2H, J=8Hz), 4.25 (q, 1H, J=5Hz), 3.92 (m, 2H), 3.33 (m, 1H), 3.06 (m, 1H), 1.01 (t, 3H, J=7Hz).

approximately 0.04-0.05 mL of  $\text{NH}_4\text{OH}$  was added so the reaction mixture was at pH 6-7. The entire reaction mixture was injected onto the HPLC for purification [Vydac peptide-protein C-18 column, 4.6 x 250 mm, linear gradient of 10% acetonitrile (0.1% (TFA): $\text{H}_2\text{O}$  (0.1% TFA) to 90% acetonitrile (0.1% TFA): $\text{H}_2\text{O}$  (0.1% TFA) over 30 minutes, 1 mL/min]. The retention time of 8-10 is 17 minutes under these conditions. Fractions containing the majority of the radioactivity were pooled, lyophilized and diluted with ethanol to give approximately 1 mCi of 8-10, which coeluted on HPLC analysis with an authentic sample of 8-8.

Instrumentation: Analytical and preparative HPLC was carried out using a Waters 600E Powerline Multi Solvent Delivery System with 0.1 mL heads with a Rheodyne 7125 injector and a Waters 990 Photodiode Array Detector with a Gilson FC203 Microfraction collector. For analytical and preparative HPLC a Vydac peptide-protein C-18 column, 4.6 x 250 mm was used with a C-18 Brownlee modular guard column. The acetonitrile used for the HPLC analyses was Fisher Optima grade. The HPLC radiodetector used was a Beckman 170 Radioisotope detector. A Vydac C-18 protein and peptide column, 3.9 x 250 mm was used for analytical and preparative HPLC. Solutions of radioactivity were concentrated using a Speedvac vacuum centrifuge. Calibration curves and chemical concentrations were determined using a Hewlett Packard Model 8452A UV/Vis Diode Array Spectrophotometer. Sample radioactivities were determined in a Packard A5530 gamma counter.

3-Nitro-6-cyclopropyl-1-(t-butyl-carboxymethylene)-2-pyridinone (17-4)

- 178 -

Solid 6-cyclopropyl-3-nitro-2-(1H)-pyridinone (17-3; 1.4  
 5 g, 7.78 mmol) was added in small portions to a suspension of sodium  
 hydride (260 mg, 10.8 mmol) in THF (30 ml) at room temperature.  
 After stirring the resulting solution for 20 min, *tert*-butylbromoacetate  
 (4 ml, 27 mmol) was added. The mixture was stirred for an additional  
 30 min. then heated at 55°C for 15 hrs. After cooling to room  
 10 temperature the THF was evaporated *in vacuo* and ice carefully added to  
 the residue to destroy any excess sodium hydride. The resulting mixture  
 was extracted with 2:1:1 ethyl acetate:ether:chloroform and the extracts  
 dried over magnesium sulfate. Filtration and evaporation of the filtrate  
 gave a yellow oil as a 3:1 mixture of N and O-alkylated products  
 15 respectively. Flash column chromatography eluting with 1:1  
 hexane/ethyl acetate gave the title compound 17-4 as a yellow crystalline  
 solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.94 (m, 2 H), 1.18 (m, 2 H), 1.49 (s, 9 H),

The test procedures employed to measure  $\alpha v \beta 3$  binding and the bone resorption inhibiting activity of the compounds of the present invention are described below.

5    BONE RESORPTION-PIT ASSAY

When osteoclasts engage in bone resorption, they will literally cause the formation of pits in the surface of bone that they are acting upon. Therefore, when testing compounds for their ability to inhibit osteoclasts, it is useful to measure the ability of osteoclasts to  
10 excavate these resorption pits when the inhibiting compound is present.

Consecutive 200 micron thick cross sections from a six mm cylinder of bovine femur diaphysis were cut with a low speed diamond saw (Isomet, Beuler, Ltd., Lake Bluff, IL). Bone slices were pooled, placed in a 10% ethanol solution and refrigerated until further use.

15 Prior to experimentation, bone slices were ultrasonicated twice, 20 minutes each in H<sub>2</sub>O. Cleaned slices were placed in 96 well plates such that two control lanes and one lane for each drug dosage are available. Each lane represents either triplicate or quadruplicate cultures. The bone slices in 96 well plates were sterilized by UV  
20 irradiation. Prior to incubation with osteoclasts, the bone slices were hydrated by the addition of 0.1 ml Medium 199, pH 6.9 containing 15% fetal bovine serum and 1% penicillin/streptomycin.

Osteoclasts were isolated from the long bones of 1 to 3 day old rat pups (Sprague-Dawley) by modifications of Chambers et al., (J. Cell. Science, 66:383-399). The resulting suspension (0.75 ml/bone)  
25 was gently triturated 90-120 times using a wide bore transfer pipet. The cellular population was separated from bone fragments by a cell strainer with a 100 micron nylon mesh. 100  $\mu$ l of the cell suspension was placed onto each bone slice. Test compounds were then added at the  
30 desired experimental concentrations.

Bone slices exposed to osteoclasts for 20-24 hrs were processed for staining. Tissue culture media was removed from each bone slice. Each well was washed with 200  $\mu$ l of H<sub>2</sub>O, and the bone slices were then fixed for 20 minutes in 2.5% glutaraldehyde, 0.1 M

- 195 -

cacodylate, pH 7.4. After fixation, any remaining cellular debris was removed by 2 min. ultrasonication in the presence of 0.25 M NH<sub>4</sub>OH followed by 2 X 15 min ultrasonication in H<sub>2</sub>O. The bone slices were immediately stained for 6-8 min with filtered 1% toluidine blue and 1% borax.

After the bone slices have dried, resorption pits were counted in test and control slices. Resorption pits were viewed in a Microphot Fx (Nikon) fluorescence microscope using a polarizing Nikon IGS filter cube. Test dosage results were compared with controls and resulting IC<sub>50</sub> values were determined for each compound tested.

The appropriateness of extrapolating data from this assay to utility and use in mammalian (including human) disease states is supported by the teaching found in Sato, M., *et al.*, Journal of Bone and Mineral Research, Vol. 5, No. 1, 1990. That article teaches that certain bisphosphonates have been used clinically and appear to be effective in the treatment of Paget's disease, hypercalcemia of malignancy, osteolytic lesions produced by bone metastases, and bone loss due to immobilization or sex hormone deficiency. These same bisphosphonates are then tested in the resorption pit assay described above to confirm a correlation between their known utility and positive performance in the assay.

#### EIB ASSAY

Duong *et al.*, J. Bone Miner. Res., 8:S 378, describe a system for expressing the human integrin  $\alpha v \beta 3$ . It has been suggested that the integrin stimulates attachment of osteoclasts to bone matrix, since antibodies against the integrin, or RGD-containing molecules, such as echistatin (European Publication 382 451), can effectively block bone resorption.

30

#### Reaction Mixture:

1. 175  $\mu$ l TBS buffer (50 mM Tris•HCl pH 7.2, 150 mM NaCl, 1% BSA, 1 mM CaCl<sub>2</sub>, 1 mM MgCl<sub>2</sub>).

- 196 -

2. 25  $\mu$ l cell extract (dilute with 100 mM octylglucoside buffer to give 2000 cpm/25  $\mu$ l).
3.  $^{125}$ I-echistatin (25  $\mu$ l/50,000 cpm) (see EP 382 451).
4. 25  $\mu$ l buffer (total binding) or unlabeled echistatin (non-specific binding).

The reaction mixture was then incubated for 1 h at room temp. The unbound and the bound  $\alpha v \beta 3$  were separated by filtration using a Skatron Cell Harvester. The filters (prewet in 1.5% poly-ethyleneimine for 10 mins) were then washed with the wash buffer (50 mM Tris HCl, 1mM  $\text{CaCl}_2/\text{MgCl}_2$ , pH 7.2). The filter was then counted in a gamma counter.

13. 50 mM octylglucoside in binding buffer: 50-OG buffer

PROCEDURE:

1. Pretreatment of SPA beads:  
5 500 mg of lyophilized SPA beads were first washed four times with 200 ml of 50-OG buffer and once with 100 ml of binding buffer, and then resuspended in 12.5 ml of binding buffer.
2. Preparation of SPA beads and receptor mixture  
10 In each assay tube, 2.5  $\mu$ l (40 mg/ml) of pretreated beads were suspended in 97.5  $\mu$ l of binding buffer and 20  $\mu$ l of 50-OG buffer. 5  $\mu$ l (~30 ng/ $\mu$ l) of purified receptor was added to the beads in suspension with stirring at room temperature for 30 minutes. The mixture was then centrifuged at 2,500 rpm in a  
15 Beckman GPR Benchtop centrifuge for 10 minutes at 4°C. The pellets were then resuspended in 50  $\mu$ l of binding buffer and 25  $\mu$ l of 50-OG buffer.
3. Reaction  
20 The following were sequentially added into Optiplate in corresponding wells:  
(i) Receptor/beads mixture (75  $\mu$ l)  
(ii) 25  $\mu$ l of each of the following: compound to be tested, binding buffer for total binding or 8-8 for non-specific  
25 binding (final concentration 1  $\mu$ M)  
(iii) 8-10 in binding buffer (25  $\mu$ l, final concentration 40 pM)  
(iv) Binding buffer (125  $\mu$ l)  
(v) Each plate was sealed with plate sealer from PACKARD and  
30 incubated overnight with rocking at 4°C
4. Plates were counted using PACKARD TOPCOUNT
5. % inhibition was calculated as follows:  
A = total counts

- 198 -

B = nonspecific counts

C = sample counts

% inhibition =  $\{[(A-B)-(C-B))/(A-B)]/(A-B) \times 100$

## 5 OCFORM ASSAY

Osteoblast-like cells (1.8 cells), originally derived from mouse calvaria, were plated in CORNING 24 well tissue culture plates in  $\alpha$  MEM medium containing ribo- and deoxyribonucleosides, 10% fetal bovine serum and penicillin-streptomycin. Cells were seeded at 40,000/well in the morning. In the afternoon, bone marrow cells were prepared from six week old male Balb/C mice as follows:

Mice were sacrificed, tibiae removed and placed in the above medium. The ends were cut off and the marrow was flushed out of the cavity into a tube with a 1 mL syringe with a 27.5 gauge needle. The marrow was suspended by pipetting up and down. The suspension was passed through  $>100 \mu\text{m}$  nylon cell strainer. The resulting suspension was centrifuged at  $350 \times g$  for seven minutes. The pellet was resuspended, and a sample was diluted in 2% acetic acid to lyse the red cells. The remaining cells were counted in a hemacytometer. The cells were pelleted and resuspended at  $1 \times 10^6$  cells/mL. 50  $\mu\text{L}$  was added to each well of 1.8 cells to yield 50,000 cells/well and 1,25-dihydroxy-vitamin D<sub>3</sub>(D<sub>3</sub>) was added to each well to a final concentration of 10 nM. The cultures were incubated at 37°C in a humidified, 5% CO<sub>2</sub> atmosphere. After 48 h, the medium was changed. 72 h after the addition of bone marrow, test compounds were added with fresh medium containing D<sub>3</sub> to quadruplicate wells. Compounds were added again after 48 h with fresh medium containing D<sub>3</sub>. After an additional 48 h the medium was removed, cells were fixed with 10% formaldehyde in phosphate buffered saline for 10 minutes at room temperature, followed by a 1-2 minute treatment with ethanol:acetone (1:1) and air dried. The cells were then stained for tartrate resistant acid phosphatase as follows:

The cells were stained for 10-15 minutes at room temperature with 50 mM acetate buffer, pH 5.0 containing 30 mM

- 199 -

sodium tartrate, 0.3 mg/mL Fast Red Violet LB Salt and 0.1 mg/mL Naphthol AS -MX phosphate. After staining, the plates were washed extensively with deionized water and air dried. The number of multinucleated, positive staining cells were counted in each well.

#### Methods:

1. Plates (96 well, Nunc Maxi Sorp) were coated overnight at 4 °C with human vitronectin (3 ug/ml) in 50 mM carbonate buffer (pH 9/6), using 100  $\mu$ l/well. Plates were then washed 25 2X with DPBS and blocked with 2% BSA in DPBS for 2h at room temperature. After additional washes (2X) with DPBS, plates were used for cell attachment assay.
2. 293 ( $\alpha$  v beta 5) cells were grown in MEM media in presence of 10% fetal calf serum to 90% confluence. Cells were then lifted from dishes with 1X Trypsin/EDTA and 30 washed 3X with serum free MEM. Cells were resuspended in attachment medium (3 X 10<sup>5</sup> cells/ml).
3. Test compounds were prepared as a series of dilutions at 2X concentrations and added as 50  $\mu$ l/well. Cell suspension was

- 200 -

- then added as 50 ml/well. Plates were incubated at 37 °C with 55 CO<sub>2</sub> for 1 hour to allow attachment.
4. Non-adherent cells were removed by gently washing the plates (3X) with DPBS and then incubated with glucosaminidase substrate solution (100 µl/well), overnight at room temperature in the dark. To quantitate cell numbers, standard curve of glucosaminidase activity was determined for each experiment by adding samples of cell suspension directly to wells containing the enzyme substrate solution.
5. The next day, the reaction was developed by addition of 185 µl/well of glycine/EDTA solution and reading absorbance at 405 nm using a Molecular Devices V-Max plate reader. Average test absorbance values (4 wells per test samples) were calculated. Then, the number of attached cells at each drug concentration was quantitated versus the standard curve of cells using the Softmax program.

#### EXAMPLE OF A PHARMACEUTICAL FORMULATION

As a specific embodiment of an oral composition, 100 mg of compound 3-13 is formulated with sufficient finely divided lactose to provide a total amount of 580 to 590 mg to fill a size O hard gel capsule.

Representative compounds of the present invention were tested and found to bind to human  $\alpha v \beta 3$  integrin. These compounds were found to have IC<sub>50</sub> values in the range of 0.1 to 100 nM in the SPA assay.

Representative compounds of the present invention were tested and found to inhibit  $\geq 50\%$  the attachment of  $\alpha v \beta 5$  expressing cells to plates coated with vitronectin at concentrations of 1 µM.

While the invention has been described and illustrated in reference to certain preferred embodiments thereof, those skilled in the art will appreciate that various changes, modifications and substitutions can be made therein without departing from the spirit and scope of the

- 201 -

invention. For example, effective dosages other than the preferred doses as set forth hereinabove may be applicable as a consequence of variations in the responsiveness of the mammal being treated for severity of bone disorders caused by resorption, or for other indications for the compounds of the invention indicated above. Likewise, the specific pharmacological responses observed may vary according to and depending upon the particular active compound selected or whether there are present pharmaceutical carriers, as well as the type of formulation and mode of administration employed, and such expected variations or differences in the results are contemplated in accordance with the objects and practices of the present invention. It is intended, therefore, that the invention be limited only by the scope of the claims which follow and that such claims be interpreted as broadly as is reasonable.

WHAT IS CLAIMED IS:

1. A method of eliciting a vitronectin receptor antagonizing effect in a mammal in need thereof, comprising  
 5 administering to the mammal a therapeutically effective amount of a compound of the formula

wherein X is selected from

- 10 a 5- or 6-membered monocyclic aromatic or nonaromatic ring system containing 0, 1, 2, 3 or 4 heteroatoms selected from N, O or S wherein the 5- or 6-membered ring system is either unsubstituted or substituted with one or more groups chosen from R<sup>1</sup>, R<sup>2</sup>, R<sup>15</sup> or R<sup>16</sup>;  
 15 a 9- to 10-membered polycyclic ring system, wherein one or more of the rings is aromatic, and wherein the polycyclic ring system contains 0, 1, 2, 3 or 4 heteroatoms selected from N, O or S, and wherein the polycyclic ring system is either unsubstituted  
 20 or substituted with one or more groups chosen from R<sup>1</sup>, R<sup>2</sup>, R<sup>15</sup> or R<sup>16</sup>;

Y is selected from

- 203 -

Z is

a 5-11 membered aromatic or nonaromatic mono- or polycyclic ring system containing 0 to 6 double bonds, and containing 0 to 6 heteroatoms chosen from N, O and S, and wherein the ring system is either unsubstituted or substituted with one or more groups independently selected from R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup>; provided that Z is not a 6-membered monocyclic aromatic ring system, an isoxazoline ring or an isoxazole ring;

R<sup>1</sup>, R<sup>2</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>13</sup>, R<sup>14</sup>, R<sup>15</sup> and R<sup>16</sup> are each independently selected from

26. A pharmaceutical composition comprising the compound of Claim 19 and a pharmaceutically acceptable carrier.

27. A pharmaceutical composition made by combining a compound of Claim 19 and a pharmaceutically acceptable carrier.

28. A process for making a pharmaceutical composition comprising combining a compound of Claim 19 and a pharmaceutically acceptable carrier.

29. A method of eliciting a vitronectin receptor antagonizing effect in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of the composition of Claim 26.

30. A method of treating or preventing a condition mediated by antagonism of a vitronectin receptor in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of the composition of Claim 26.

31. A method of inhibiting bone resorption in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of the composition of Claim 26.

32. A method of treating osteoporosis in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of the composition of Claim 26.

33. A method of treating tumor growth in a mammal in need thereof, comprising administering to the mammal a therapeutically effective amount of a compound of Claim 19 and one or more agents known to be cytotoxic or antiproliferative.

## INTERNATIONAL SEARCH REPORT

International application No.
